

Stochastic Smooth Adversarial Warping (SSAW)

A local augmentation module that searches bounded smooth drifts and returns the worst-case physically plausible view.

What SSAW is designed to generate

Bounded low-frequency amplitude drifts that are adversarial enough to stress the model, but still smooth and physically plausible enough to serve as a consistency view in streaming TTA.

$$x_t \rightarrow \{w^{(i)}(\tau)\}_{i=1}^{N_{cand}} \rightarrow \{x_t^{(i)}\} \rightarrow x_t^{pert}$$
